

SITEX® Teeth Coupling

SITEX®

SITEX® FL

SITEX® teeth couplings

Description

SITEX® couplings consist of two toothed hubs which are connected with one internally toothed sleeve. The hubs are made of steel and the teeth, which are both profiled and section crowned,

are obtained from milling. The sleeve is manufactured from stabilized 6.6 superpolyamid resin.

Features

SITEX® couplings are members of the elastic coupling family range. In an excellent way they compensate for axial, radial, and angular displacement of the connected shafts. The double cardanic action eliminates the imposition of loads on the shafts which results from radial and axial misalignment.

The torsional rigidity of the sleeve prevents angular speed variation.

The combination of steel hubs with Polyamid sleeve makes the coupling maintenance and lubrication free.

The particular toothed profile prevents contact of tooth edges with the sleeve, ensuring long life of the coupling.

Performance

Mounting can be in both the horizontal and vertical planes. Installation is simple and quick, which lower installation costs.

The coupling is suitable for operating in temperatures ranging from - 25°C to + 90°C.

For short intervals, temperatures of + 125°C can be tolerated. Components of the coupling are resistant to all types of lubricants and hydraulic fluids.

Coding

When placing orders, it is necessary to indicate:

- number of hubs required
- hub size
- number of sleeves
- sleeve size
- special machining (bore, stop screws, keyway etc.)

Dimensional characteristics

Due to compact dimensions and excellent performances, SITEX® couplings may be used in a wide range of applications.

Couplings are available from stock, both the standard and the "long" hub execution, which entirely covers the motor shaft.

SITEX® coupling selection

Selection according to torque

The maximum starting torque of the driver or driven machine must not exceed the maximum torque the coupling can bear. With uniform loading and well aligned shafts, the coupling can be

employed at all torques up to the maximum. In case of irregular torque, consider that the SITEX® coupling can bear peak loads up to 3 times the nominal torque indicated.

The values shown in the table for radial and angular misalignment, must be corrected in case they are simultaneously acting on the coupling.

The sum of the admissible value (A) and the respective values shown in the table must be lower or equal to 1.

$$\frac{\Delta K_{rA}}{\Delta K_r} + \frac{\Delta K_{wA}}{\Delta K_w} \leq 1$$

Mounting instructions

- Fix the hubs to the shafts, taking care to align the inner surfaces with the corresponding shaft ends.
- Insert the sleeve on the two hubs adjusting the distance (quote "b") of the same ones trying at the same time to align the two shafts as much as possible.

- Fix into position the two elements to be coupled.
- Before rotating the coupling, be sure the sleeve is free to move axially.

SITEX® Nylex

Couplings fully made of polyamide.

Two executions are available:

- **CV**: in 2 parts (1 hub and one sleeve including the hub);
- **C**: in 3 parts (2 hubs and one sleeve).

Designed for light applications, low cost and available with finished bore keyway and thread for set screw.

Temperature range: - 25°C ÷ + 100°C
